Professional Summary

Full Stack Developer (Node.js, React/Next.js) with proven experience building scalable, high-performance web applications end-to-end – from responsive interfaces in React/Next.js to robust backend systems in NestJS. Track record designing real-time IoT data pipelines, optimizing system performance under high concurrency, and delivering secure, production-ready solutions on cloud infrastructure (AWS), asynchronous processing (Redis, BullMQ), and modern database architecture (PostgreSQL). Integrate Claude Code into my daily workflow for feature planning, architecture research, and code generation, including custom skills and subagent orchestration for team tasks.

Professional Experience

Kwan Tecnologia — Full Stack Developer

January 2025 – July 2026

- Increased system availability 40% by architecting an asynchronous job-processing pipeline with BullMQ and Redis.
- Achieved 100% data integrity in critical image-management modules by implementing atomic database transactions.
- Cut API response times and reduced database load by introducing Redis caching and cursor-based pagination for high-volume queries.
- Enabled real-time, bidirectional communication across all connected IoT devices by designing and implementing an MQTT-based gateway.
- Reached the entire user base with real-time updates by building a React Native app with scalable push notifications, alongside production-ready SSR interfaces in Next.js and MUI.
- Secured platform-wide user identity by implementing RBAC with AWS Cognito and a JWT-based password-recovery flow using SendGrid magic links, while automating recurring operations via scheduled cron jobs.
- Defined the optimal caching (Redis) and message-queue (BullMQ) architecture through Claude Code-assisted research and thorough testing, and built custom skills to constrain the scope of AI-generated changes.

Bovino IO — University Capstone Project — Backend Engineer

September 2025 – December 2025

- Enabled real-time processing of IoT telemetry under high concurrency by architecting a scalable backend with NestJS and TypeScript.
- Connected ESP32 and Raspberry Pi devices for real-time health monitoring by building an end-to-end BLE data pipeline for edge computing.
- Handled large-scale data spikes reliably by designing a PostgreSQL database with Redis caching and processing queues.
- Achieved sub-50ms Time-to-First-Byte for near real-time health alerts by containerizing services with Docker and deploying to AWS; delivered a fully functional MVP with a validated business model.
- Sped up ESP32 firmware and MQTT-to-backend gateway development with Claude Code, achieving near-instant bidirectional communication between edge devices and the backend.

EduPay — University Project — Backend Engineer

September 2024 – December 2024

- Delivered a payment management platform end-to-end by owning the backend from architecture through deployment.
- Secured user sessions and platform access by implementing JWT-based authentication.
- Enabled real-time payment confirmation by integrating Stripe (recurring and one-time payments) with full webhook handling.
- Supported all core payment and user-management flows by designing the relational database schema and RESTful API architecture.

Technical Skills

AI & Automation: Claude Code, custom Skills design, subagent orchestration, AI-assisted feature planning (Plan Mode), prompt engineering

Frontend: React, Next.js, TypeScript, MUI (Material UI), TailwindCSS, SSR

Backend: Node.js, NestJS, Express, REST, GraphQL, TypeORM, Prisma, BullMQ, Redis, Cron Jobs

IoT & Real-Time Systems: MQTT, BLE (Bluetooth Low Energy), ESP32, Raspberry Pi, Edge Computing

Mobile: React Native

Cloud & DevOps: AWS (Cognito, EC2), Docker, Cloudflare, GitHub Actions, Git

Databases: PostgreSQL, SQL Server

Payments: Stripe (recurring and one-time payments, webhooks)

Languages: Spanish (Native), English (Conversational – B1/B2)

Education

Universidad Tecnologica Metropolitana — Multiplatform Software Engineering

2022 – 2026
